

**O14 (continued)**

September 30, 2020 using a national web-panel. Data collection focused on NC households that were SNAP eligible or included youth receiving free or reduced-priced school meals. An email was sent to parents of youth aged 11–17 years who provided consent for their child (who also assented) to participate in the survey.

**Measurable Outcome/Analysis:** Survey items asked respondents to report typical consumption of 5 different SSBs; report household characteristics and parental practices associated with SSB consumption; and answer a number of questions designed to assess willingness and self-efficacy related to not drink SSBs in settings where SSBs are commonly consumed.

**Results:** The majority (87%) of the 311 youth completed the survey reported drinking at least 1 SSB per day. Soda (40%) and fruit-flavored drinks (36%) were the mostly commonly consumed SSBs, while energy drinks (12%) were the least commonly consumed. Consumption patterns did not differ between younger (11–13 years) and older (14–17 years) youth. There was a strong association between perceived value of SSBs (ie, helps youth focus, gives youth a boost) and higher levels of consumption. For older but not younger youth, perceptions related to better health and reduction efficacy were associated with drinking fewer SSBs per week.

**Conclusion:** Findings provide a number of key insights that will contribute to the development of messages aimed at curbing SSB consumption. For example, the importance of youth perceived functional factors has not been well documented in the literature as a driver of SSB consumption.

**Funding:** Supplemental Nutrition Assistance Program - Education.

**O15 Montana Offers Innovative Virtual School Nutrition Leadership Institute During COVID-19**

Gretchen Groves, RDN, LN, gretchen.groves@montana.edu, Montana Team Nutrition, Montana State University, 324 Reid Hall, PO Box 173370, Bozeman, MT, 59717; Katie Bark, RDN, LN, Montana Team Nutrition, Montana State University; Aubree Roth, RDN, Montana Team Nutrition, Montana State University; Carmen Byker Shanks, PhD, RDN, LN, Montana State University

**Objective:** Evaluate the Montana Cook Fresh Leadership Institute (MCF) for K-12 school nutrition staff, offered virtually due to COVID-19 restrictions.

**Use of Theory or Research:** The MCF curriculum was developed using a participatory approach from Montana Team Nutrition staff, school nutrition professionals, and state-level administration to include evidence-based materials and learning strategies.

**Target Audience:** Twenty-two nutrition professionals from 9 Montana school districts in July 2020.

**Program Description:** MCF was developed as a 30-hour, 5-day in-person training during 2018 and 2019. In 2020, the format of MCF was adjusted to a 10 day, 30-hour a day virtual workshop. MCF utilized live video conferencing and independent work completed via an online learning management platform. Topics addressed USDA regulations, procurement, food production, culinary skills, and emergency preparedness.

**Evaluation Methods:** A pre and post self-reported survey tool and a post MCF evaluation tool were applied. Descriptive statistics and ANOVA was applied to determine significant changes from pre to post (P < 0.05).

**Results:** Pre (n = 22) and post surveys (n = 21) determined an average 9.96% percent change in mean comfort level, confidence, and likelihood of future behavior (P < 0.05). The emergency preparedness plan demonstrated the greatest increase in comfort level (+26.50%; P < 0.05). Although not significant, comfort levels with farm to school (+16.98%) and USDA foods (14.06%) increased, while scratch cooking (-4.40%) decreased. Using herbs and spices in recipes (+20.48%) and completing a daily production record (+23.31%) demonstrated the greatest increases in reported comfort level (P < 0.05). Participants were most likely to participate in future remote professional development activities (+16.40%) and use a new recipe that includes fresh and dried legumes (+13.71%), although not significant. Seventy-five percent of knowledge questions demonstrated increases in correct answers.

**Conclusion:** The pre to post evaluation results indicate that a virtual MCF can achieve positive learning outcomes. Future training efforts should be focused on exploring ways to improve participants comfort with scratch cooking and batch cooking in a virtual format.

**Funding:** USDA Team Nutrition Montana No Kid Hungry.

**O16 Preliminary Efficacy of a Virtual Nutrition Intervention for Adolescents with Autism Spectrum Disorder**

Acadia Buro, MS, acadia@usf.edu, University of South Florida, 13201 Bruce B Downs Blvd, Tampa, FL, 33612; Mikaela Strange, BS, University of South Florida; Syed Hasan, University of South Florida; Heewon Gray, PhD, RDN, University of South Florida

**Background:** Adolescents with autism spectrum disorder (ASD) are at an increased risk of obesity and unhealthy eating behaviors, yet there is a lack of interventions to improve healthy eating and reduce the risk of obesity in this population.

**Objective:** This study examined the preliminary efficacy of a virtual implementation of a nutrition intervention for adolescents with ASD aged 12-20 years, measured by differences in pre-/post-intervention means for BMI z-score, fruit and vegetable intake, added sugar intake, and psychosocial determinants of dietary intake.

**Study Design, Setting, Participants:** One-group pre-test-posttest design was used. Bringing Adolescent Learners with Autism Nutrition and Culinary Education (BALANCE) is an 8-week virtual nutrition intervention for adolescents with ASD based on Social Cognitive Theory (SCT). Six groups of adolescents with ASD aged 12-20 years (n = 27; group size ranged 2-7) in Tampa, Florida participated.

**Measurable Outcome/Analysis:** Height and weight were measured via ruler and scale as instructed virtually by
