Supplemental Nutrition Assistance Program Education (SNAP-Ed) at the Michigan Fitness Foundation is a collaborative of local and regional organizations whose work focuses on improving the health of Michigan’s most vulnerable citizens. The purpose of this project was to design a common evaluation to support local-level objectives that can be aggregated at the state level. Youth (n=1,512; grades 6-12) and adults (n=647; aged 18+) who received SNAP-Ed programming received a validated dietary questionnaire pre- and post-intervention. Data were aggregated at the state-level, and differences pre- and post-intervention for fruit and vegetable consumption frequency were evaluated. A statistically significant increase was found for youth frequency of fruit consumption (p=0.022) and of vegetable consumption (p=0.002), and results were similar for adults (fruit consumption: p<0.001; vegetable consumption: p<0.001). Overall, implementation of locally relevant SNAP-Ed programming selected by community organizations can positively impact fruit and vegetable consumption.
